

What did I learn during this course.

1.

The first thing I now know how to do is setup the environment where to actually put the code in. After putting a little bit of code I learned how to use the npm commands and how to set up a liveserver where I can follow along how my website is looking. I learned about scss and how to turn it into regular css.

2.

I learned about html. What it is and how to do things with it. I learned about nesting which makes it a lot easier to change up how a website looks like. I learned how html and scss connect to each other and how they communicate.

3.

I learned how to use javascript and how it can be used to affect the overall look of the website. I learned to do an animation with js. I learned how to do a menu and create links and how to travel from html to html.

4.

I learned about mixins how to make them and how they make my life as a front end developer much easier. I learned overall how to navigate the files and how I can take the development further if I want to.

5.

I learned about CSS grids and how they can be useful when making websites. I can use the grid to place items in them and with the grid I can change the layout more easily than without the grid. I learned how to make the page responsive to different screen sizes.

6.

I learned how to use another grid layout tool the Flexbox. I rather liked the grid more than the flexbox but it is good to know about as many tools as possible in order to make developing websites more fluid.

7.

The final part I learned how to actually publish a website and I almost couldn't believe that it works.

8.

On my own I fixed some bugs like when the screen would not work on my phone and the text in the page would be weirdly laid out. I made the projects page look a lot more like me. I changed the color theme and some layouts. Took out some boxes, added some boxes. I made a javascript code for copying the text from my contact information boxes which actually took a while to pull off.

From this we can see that actual learning was done during the course since I could confidently change up things, fix things and create completely new things.
